Abstract

The use of information and communication technology in scientific research has been hailed as the means to a new larger-scale, more efficient, and cost-effective science. But although scientists increasingly use computers in their work and institutions have made massive investments in technology, we still have little idea how computing affects the way scientists work and the kind of knowledge they produce. In *Systematics as Cyberscience*, Christine Hine explores these questions by examining the developing use of information and communication technology in one discipline, systematics (which focuses on the classification and naming of organisms and exploration of evolutionary relationships). Her sociological study of the ways that biologists working in this field have engaged with new technology is an account of how one of the oldest branches of science transformed itself into one of the newest and became a cyberscience.

Combining an ethnographic approach with historical review and textual analysis, Hine investigates the emergence of a virtual culture in systematics and how that new culture is entwined with the field’s existing practices and priorities. Hine examines the policy perspective on technological change, the material culture of systematics (and how the virtual culture aligns with it), communication practices with new technology, and the complex dynamics of change and continuity on the institutional level. New technologies have stimulated reflection on the future of systematics and prompted calls for radical transformation, but the outcomes are thoroughly rooted in the heritage of the discipline. Hine argues that to understand the impact of information and communication technology in science we need to take account of the many complex and conflicting pressures that contemporary scientists navigate. The results of technological developments are rarely unambiguous gains in efficiency, and are highly discipline-specific.

Table of Contents

Acknowledgments ix
1 Introducing the Study of a Cyberscience 1
2 Science, ICTs, and the Imagining of Change 19
3 Computers and the Politics of Systematics 63
4 Behind the Scenes and Across the Globe
   Virtualizing the Material Culture of Systematics 99
5 Communication and Disciplinarity 149
6 Individuals, Institutions, Initiatives 187
7 Conclusion: Socially Meaningful Cyberscience 241
   Appendix: Messages Sent to the Taxacom List Asking for Input 263
   Notes 267
   References 269
   Series List 293
   Index 297
